LIFE EXPECTANCY AT BIRTH: A DATA-DRIVEN ANALYSIS

Exploring Patterns, Inequalities, and Gender Differences (2000–2021)

Joyce Ebruphiyo Etata

DATASET OVERVIEW

- **What is this dataset about?**
- The dataset contains 12936 rows and 15 columns
- Contains life expectancy data across multiple countries
- Covers both **male, female and total sexes populations**
- Spans across multiple years (2000–2021)
- **Key Variables:**
- Country (Geo-Name-Short)
- Year (DIM-Time)
- Gender (DIM-Sex)
- Life Expectancy (Amount-N)
- **Purpose of Analysis:**
  To explore trends, comparisons, and disparities in global life expectancy.

OBSERVATIONS AT FIRST GLANCE

- At first glance, the dataset shows:
- Life expectancy varies significantly across countries
- Data is structured and suitable for trend analysis
- Includes both global patterns and gender differences
- Some countries appear to consistently perform better than others

KEY QUESTIONS(IDENTIFYING MY CURIOSITY)

- **This analysis is guided by three main questions:**
- How has global life expectancy changed over time, and what does this suggest about global development?
- Which countries lead in life expectancy, and what does this reveal about global inequality?
- How does Nigeria compare to the global average and what role does gender play?

INSIGHTS FROM VISUALIZATIONS

1. Global Trend

Life expectancy has steadily increased over time

Indicates improvements in healthcare, nutrition, and living conditions

2. Top & Bottom Countries

Some countries consistently rank high in life expectancy

Others remain significantly lower

This highlights **global inequality in health outcomes**

3. Nigeria vs Global Average

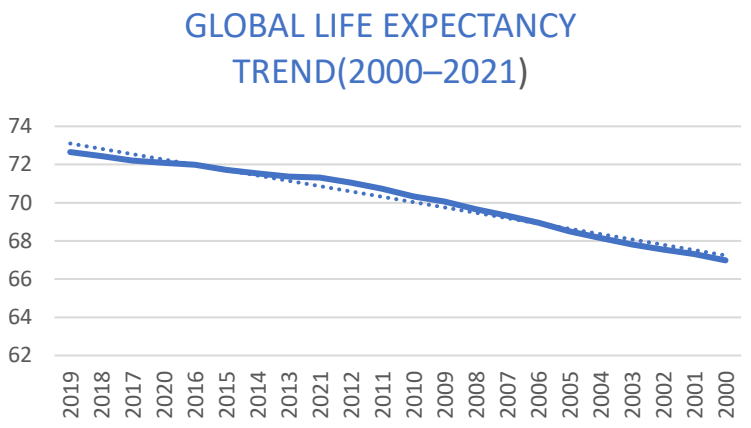
Nigeria consistently falls below the global average

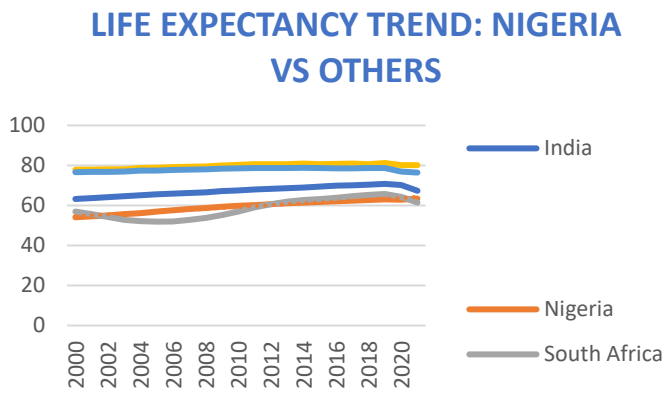
Suggests disparities in healthcare access and development

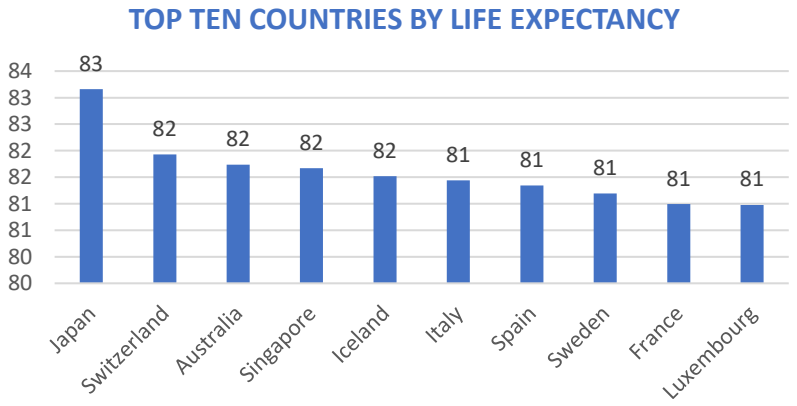
4. Gender Comparison

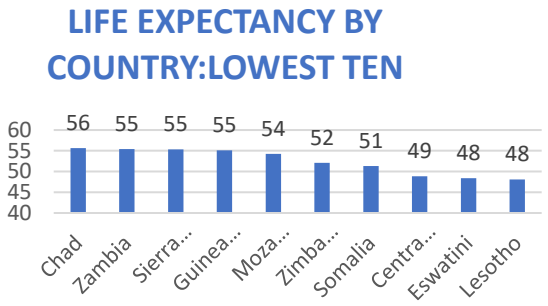
Female life expectancy is higher than male across most years

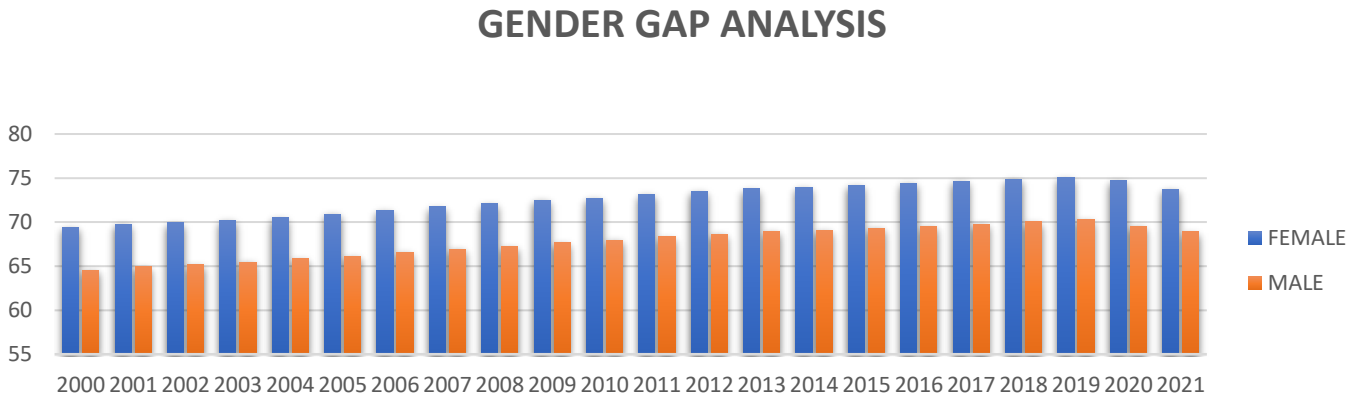
Likely influenced by biological and lifestyle factors











CONCLUSION & LIMITATIONS

Conclusion

- Global life expectancy is improving over time
- However, significant inequalities still exist between countries
- Gender differences remain consistent across regions
- Overall, the data reflects both progress and disparity in global health.

• Limitation

- Dataset does not include causes (e.g., income, healthcare quality)
- Limited to available countries and years
- Assumes data accuracy without external validation
