# LIFE EXPECTANCY AT BIRTH: A DATA-DRIVEN ANALYSIS

**Exploring Patterns, Inequalities, and Gender Differences (2000–2021)**

Joyce Ebruphiyo Etata

# DATASET OVERVIEW

- **What is this dataset about?**
- The dataset contains 12936 rows and 15 columns
- Contains life expectancy data across multiple countries
- Covers both **male, female and total sexes populations**
- Spans across multiple years (2000–2021)
- **Key Variables:**
- Country (Geo-Name-Short)
- Year (DIM-Time)
- Gender (DIM-Sex)
- Life Expectancy (Amount-N)
- **Purpose of Analysis:**
  To explore trends, comparisons, and disparities in global life expectancy.

# OBSERVATIONS AT FIRST GLANCE

- At first glance, the dataset shows:
- Life expectancy varies significantly across countries
- Data is structured and suitable for trend analysis
- Includes both global patterns and gender differences
- Some countries appear to consistently perform better than others

# KEY QUESTIONS(IDENTIFYING MY CURIOSITY)

- **This analysis is guided by three main questions:**
- How has global life expectancy changed over time, and what does this suggest about global development?
- Which countries lead in life expectancy, and what does this reveal about global inequality?
- How does Nigeria compare to the global average and what role does gender play?

# INSIGHTS FROM VISUALIZATIONS

**1. Global Trend**

Life expectancy has steadily increased over time

Indicates improvements in healthcare, nutrition, and living conditions

**2. Top & Bottom Countries**

Some countries consistently rank high in life expectancy Others remain significantly lower

This highlights **global inequality in health outcomes**

**3. Nigeria vs Global Average**

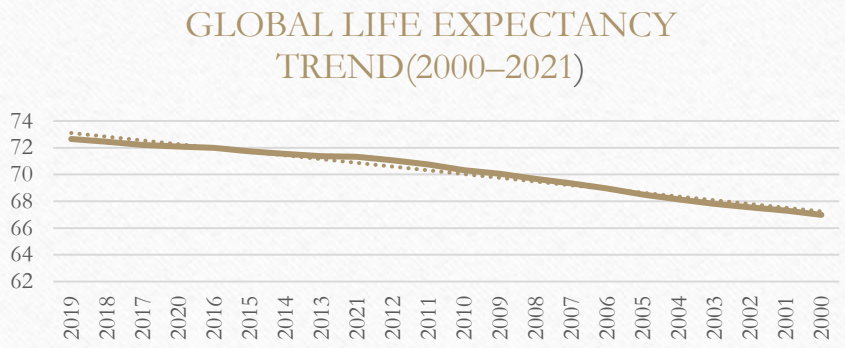
Nigeria consistently falls below the global average

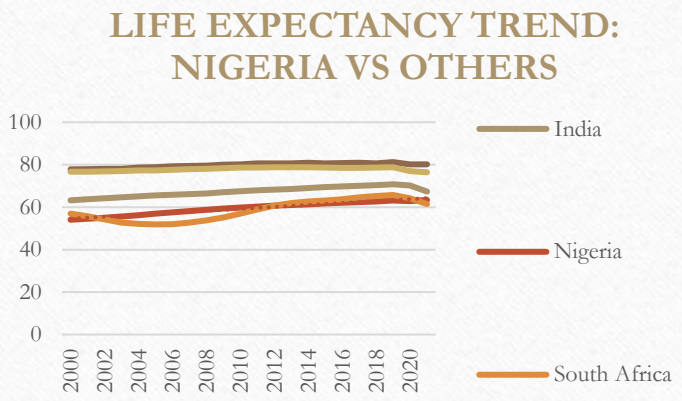
Suggests disparities in healthcare access and development

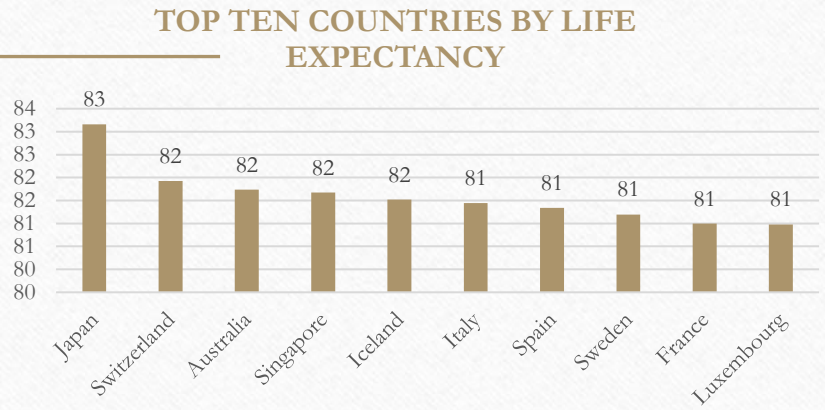
**4. Gender Comparison**

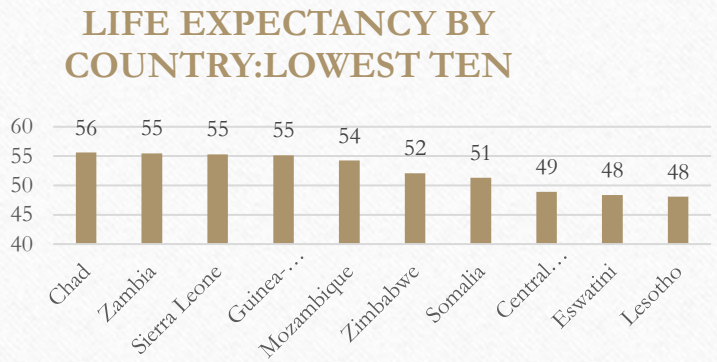
Female life expectancy is higher than male across most years

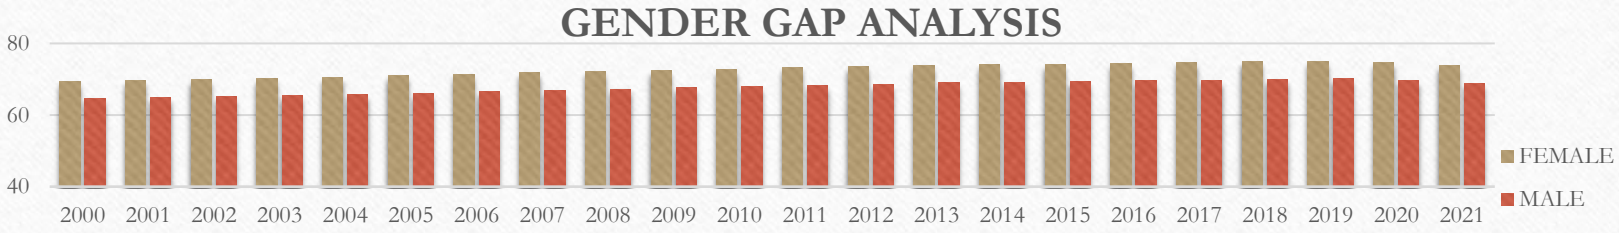
Likely influenced by biological and lifestyle factors











# CONCLUSION & LIMITATIONS

## Conclusion

- Global life expectancy is improving over time
- However, significant inequalities still exist between countries
- Gender differences remain consistent across regions
- Overall, the data reflects both progress and disparity in global health.

## Limitation

- Dataset does not include causes (e.g., income, healthcare quality)
- Limited to available countries and years
- Assumes data accuracy without external validation
- Data Lag: The most recent data point is from 2021; current trends in 2024-2026 may differ.
- Impact of COVID-19: The 2020-2021 data points reflect an anomalous period in global

health history
